

a Estimated dopamine-neuron mix of every donor

b Classifier score against the mix

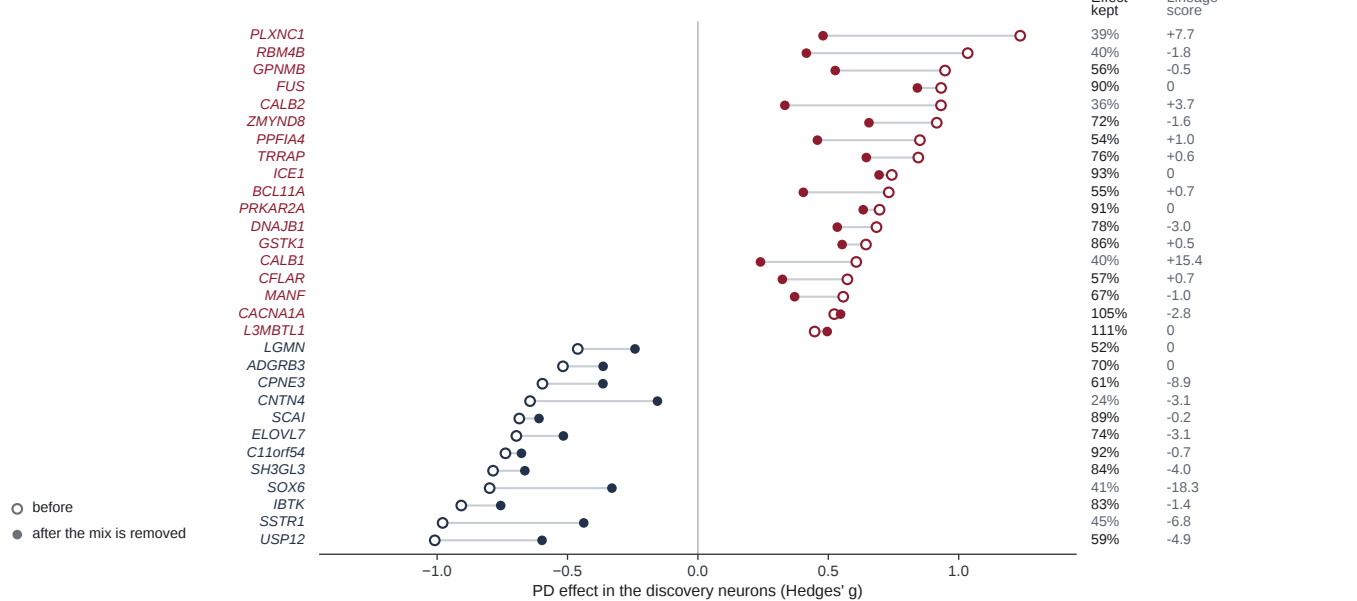

c The classifier with the neuron mix regressed out of every gene

Same 5 x 5 folds and the same model as the paper's classifier. Adding the classifier's score to the composition raises the leave-one-out AUC from 0.68 to 0.72 (likelihood-ratio P = 0.0058).

d PD effect of each panel gene before and after the mix is removed

23 of 30 genes keep at least half of their PD effect; median kept 68%.
